

EXPERIMENT 6

Simulate the lifecycle stages for UI design using the RAD model
and develop a small interactive interface using Axure RP

REG NO: 240701272

Name: Kishor Kumar Purushothaman

AIM

The aim of this experiment is to simulate the lifecycle stages of UI design using the Rapid Application Development (RAD) model and to develop a small interactive food delivery app interface.

PROCEDURE

Phase 1: Requirements Planning

- Identified key screens required for the application: Home/Food Browse, Order Confirmation.
- Defined user actions such as browsing food categories, searching for items, viewing ratings, placing orders, and receiving confirmation.
- Prepared a basic user flow mapping the journey from landing on the home screen to order confirmation.

Phase 2: User Design

- Designed app screens using GIMP, focusing on a clean and modern mobile UI.
- Created a new project in Axure RP and recreated the wireframes for all identified screens.
- Added interactive elements including category filter chips (Pizza, Burger, Pasta, etc.), food item cards with ratings and delivery time, and an 'Order Now' call-to-action.
- Incorporated reusable components such as a bottom navigation bar (Home, Search, Profile) and a top notification/profile header.
- Added annotations to document component behaviour and user interaction flows.

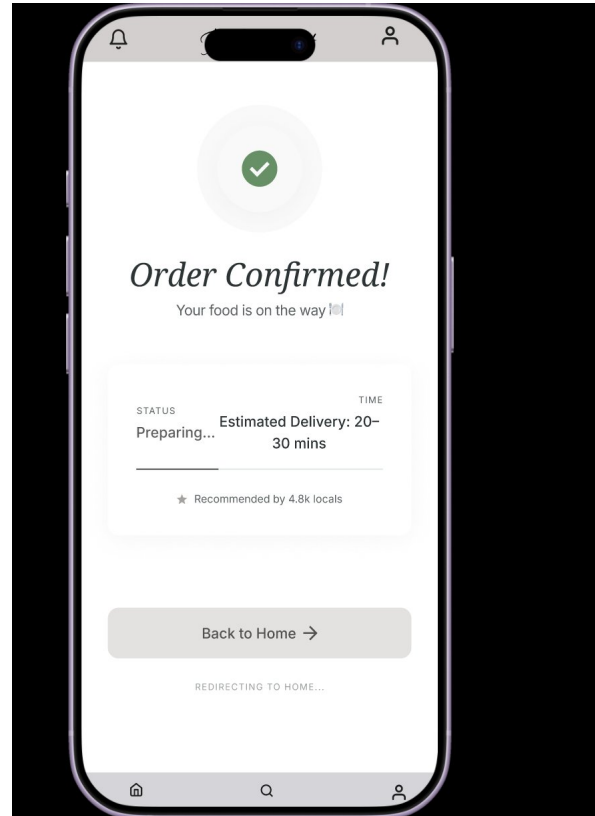

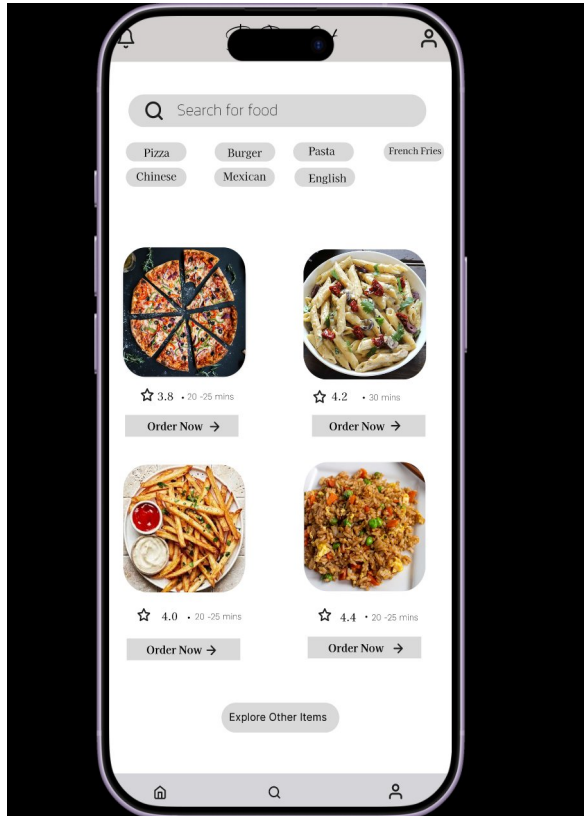

Phase 3: Construction

- Converted the wireframes into an interactive prototype by linking screens and adding navigation transitions.
- Implemented dynamic interactions: selecting a food category filters the displayed items; clicking 'Order Now' navigates to the Order Confirmation screen showing status, estimated delivery time, and a local recommendation count.
- Tested the prototype iteratively and refined layout, spacing, typography, and colour scheme for improved usability.

Phase 4: Cutover

- Finalised and exported the prototype as an HTML package and published it to Axure Cloud for stakeholder review.

- Demonstrated the complete interactive flow, from the home/food browse screen through to the order confirmation screen.
- Provided basic user guidance on navigating the prototype and interpreting the annotated design decisions.

RESULT

An interactive food delivery app prototype was successfully developed using Axure RP, demonstrating all four phases of the RAD lifecycle. The prototype includes a functional home screen with category filters, food item listings with ratings and delivery time estimates, and an order confirmation screen, validating the end-to-end user flow.
