

EXPERIMENT - 08

Name : Kishor Kumar Purushothaman

Roll No: 240701272

Aim

To create storyboards representing the user flow of a mobile e-commerce application using Balsamiq.

Introduction

Storyboards are visual representations of how users interact with an application step by step. They help designers understand user behavior and improve navigation flow.

In this experiment, a storyboard is created for a mobile e-commerce application to represent the complete process of browsing products, selecting items, and completing a purchase. This helps in designing a user-friendly and efficient interface.

Procedure (4 Steps)

Step 1: Define User Flow

- Identified key screens such as Home, Categories, Product List, Product Details, Checkout, and Payment
- Analyzed how users move from one screen to another
- Planned the complete flow from product browsing to order confirmation

Step 2: Create Wireframe Screens

- Designed basic wireframes using simple shapes and UI components
- Used elements like search bar, buttons, product images, and navigation bar
- Ensured proper alignment, spacing, and readability
- Focused on simplicity to clearly represent the structure of the app

Step 3: Design User Flow Screens

The following screens were created:

Home Screen

- Includes search bar and product offers
- Displays categories and featured products
- Acts as the starting point for user interaction

Categories Screen

- Shows different product categories such as Apparel, Electronics, Kitchen, etc.
- Helps users easily navigate to desired products

Product List Screen

- Displays list of products with image, name, and price

- Includes “Add to Cart” button for each item
- Allows users to compare products

Product Details Screen

- Shows detailed information about a product
- Includes price, rating, description, and image
- Provides option to add product to cart

Checkout Screen

- Displays selected items and total amount
- Includes input field for delivery address
- Allows users to review order before payment

Payment Screen

- Shows different payment options like UPI, Card, COD
- Displays order summary and total cost
- Includes confirmation message after successful payment

Step 4: Connect and Finalize Flow

- Arranged all screens in sequence
- Connected screens to represent navigation flow
- Verified smooth user journey from start to end
- Ensured all steps are logically connected

User Flow

Home → Categories → Product List → Product Details → Checkout → Payment → Order Confirmation

Result

The storyboard successfully represents the complete user journey of an e-commerce application. It clearly shows how users interact with different screens and complete a purchase. This helps in improving usability, navigation, and overall user experience.

Home Screen

Product List Screen

Cart Screen

Checkout Screen

Order Confirmation Screen
